5.0 out of 5 stars I was able to express myself and capture amazing moments with this camera. It became my best friend from the moment my father handed it to me Christmas of 2006. Directions, icons, and setup is very easy. Pictures are clear, concise, and can easily be edited with various kinds of software. This camera is great for things such as plants, flowers, family portraits, and macrostyle photos. It is also pretty decent with bokeh and light streams. Ive yet to have an actual problem with this camera. Its basically like the Buddy Lee of cameras. Not that Ive tried, but I have dropped it a few times on accident. Expecting it to come apart or be cracked, there was absolutely nothing wrong with it. My only slight con is thissometimes the coloring may not be as rich as some newer versions of cameras. Lighting may be a little off, etc. Still, Im very pleased with this purchase and intend on getting another point and shoot camera once this one has gone away to camera heaven. Well worth the cost. It is not compact and not the greatest. It can't even compare to my iphone 5s camera, but it is good for outdoor because it has 2.2x optical zoom. Not a bad camera to have in my car in case I need to take a few outdoor picture with zoom. What amazed me the MOST was the quality of the pictures that I received. I took a 3week trip to Greece and using the camera captured the moments perfectly, well almost perfectly. The only types of pictures that didnt come out that well were night pictures. I guess I need to read the manual more. Otherwise they turned out AWESOME. I uploaded a few for you to preview. This camera was an upgrade from a cheap Samsung 1.2MP that I had purchased in 2003. I specifically purchased this camera because of the SD card reader.

I lent it out to my mother about three years ago to take pictures of my nieces. When it was returned to me the lens extender was damaged. Apparently my sisterinlaw had gone into the guest bedroom and neglected to close the door when she left. This presented an opportunity to my very young and rambunctious nieces to topple a bookshelf in the guest bedroom, which destroyed my mothers brand new laptop and this camera. If you take care of the camera then it will last. I had no problems with it until lending it out. I would recommend this to folks looking for a solid camera. The zoom is not the greatest, but not a real problem just make sure to turn the digital on I dont think that is an automatic setting. The only drawbacks I found is the short battery life, and the 16MB memory. If you buy this camera, buy longer life batteries and more memory. The 16MB only got me 13 photos. I got another one to replace one that had broken. Despite its small pixel size, it takes great pictures. It is fairly simple to use, takes great pictures and is packed with features. It fits nicely in the hand and is compact enough to slip in a coat pocket or purse. We bought this camera for our daughters birthday. In my opinion, the camera is a winner for any adult or kid wanting a good all around digital camera. My only negative is that it is a battery hog. As with most digital cameras, you will want to make sure you get rechargeable batteries and large memory card. Learn More With a price tag that just makes it into triple figures, my expectations for this 3.2 megapixel camera were low to say the least. Initial impressions however, were quite pleasing.

Alongside the camera itself, the box contains a wrist strap, a foldout quickstart poster, a pamphlet giving details about Canon's Image Gateway online digital photo album service, a "system map" pamphlet which breaks down the accessory and connectivity options, a "Direct Print" users guide for use with compatible printers and a thorough yet easytofollow manual. And finally there's the Camera Suite 1.3 CD which comes with ArcSoft's PhotoImpression 5 and VideoImpression 2 software. The software bundle alone probably justifies a large chunk of the purchase price. Moving on to the camera itself, once more the favourable initial impression belies the low asking price. At just 107 x 53.4 x 36.8mm W x H x D the A400 is extremely pocketable, but the slablike design means it's not the most ergonomic or comfortable camera to hold. Furthermore and despite a primarily plastic construction, the A400 feels surprisingly solid, an illusion reinforced by the use of brushed aluminium for the front fascia, which incidentally also comes in green, blue and orange. On the bottom of the camera you'll find a plastic tripod socket. This isn't positioned on the lens axis and limits the creation of panoramic shots made by stitching together multiple photos taken with the camera on a tripod. However there's a very clever mode on the camera that Canon call "Stitch

Assist" which basically lets you do the same thing while handholding by showing either the left or right portion of the last image captured and allowing you to align a live image of the next shot. In addition to room for the two AA batteries, there's an SD memory card slot and a small flap behind which resides the tiny CR1220 memory backup battery. The use of AA batteries is welcomed from a point of view of availability, but I'd strongly recommend you invest in a couple of rechargeable NiMH batteries and a charger.

Canon claims about 100 photos from regular alkaline batteries when using the LCD screen and 50% flash, which seemed about right, although a set of NiMH batteries should give you around 300 shots under the same conditions. The table below gives a breakdown of what can be expected. As is common to most cameras, depressing the shutter release button half way activates the auto focus and auto exposure function. Amazingly, the A400 offers ninepoint, intelligent, through the lens auto focus but this becomes limited to just a single, centre focus point when switched off. On the opposite end of the top face is a small bank of twelve holes behind which lies a speaker for video playback. The circular lens surround dominates the front of the camera. The lens itself retracts into the camera body when not in use and is protected from dirt and scratches by a two piece sliding plastic lens cover which closes automatically. When extended, the lens protrudes about 10mm and this doesn't alter even when zooming because the lens elements move internally. Any form of optical zoom is a bonus at this price point, but at just 2.2x it is slightly limiting. The additional magnification offered by a 3.2x digital zoom extends the zoom to around 7x overall but digital zoom does nothing more than enlarge a portion of what's available to the CCD, along with a subsequent loss of quality. You can achieve the exact same thing by enlarging part of your captured image using your favourite photo editing software, and probably with superior results. Perhaps more limiting is the fact that the zoom range is equivalent to a 45/100mm lens in 35mm terms, which means its wide angle end isn't very wide at all. At f3.8 it's not a terribly fast lens either. The inclusion of a focus assist light for this kind of money is commendable, and one that other manufacturers should take note of. The flash is fairly tame with a maximum stated range of just two metres.

It's also situated very close to the lens which is usually a recipe for rampant red eye problems. However, in practise I was actually able to get good flash exposures up to six metres and more, which suggests Canon has been a touch pessimistic with its rating. Getting the focus assist light to work over that kind of distance was also nigh on impossible. The LCD is far more reliable and was probably around 98%. By "real image zoom" I mean that as the lens zooms so too does the image you see through the viewfinder. Furthermore, because it's positioned quite close to the lens, parallax errors are less pronounced which means less missing heads in your photo collection. Fortunately, logic prevails and a little practice should soon have it all making sense. Starting over on the left, the dominating feature is undoubtedly the 1.5in TFT LCD screen. This diminutive screen boasts a relatively high 115,000 pixels for its dimensions, and in practice it's not as difficult to work with as you might think, even in bright light. Immediately to the right of this is a "D" shaped button marked "Disp" which can be used to shut off the LCD to conserve battery power or to overlay or hide the current camera settings data. At the top is the zoom rocker switch, a common control that most users should be familiar with. This also magnifies the image in the LCD screen when previewing images in playback mode. Alongside this is a four position switch that sets camera mode, video capture mode, special scene mode or playback mode. Video mode does as the name suggests and lets you use the A400 as a fairly primitive video capture device. The length of captured video will vary depending on chosen resolution and memory card capacity, but the table below offers a breakdown of what can be expected for the supplied 16MB SD card. Exposure, focus and zoom are all locked during video capture which greatly reduces its usefulness.

Available presets are Portrait, Night Scene, Foliage which enhances colour saturation, Snow for limiting bluish tones and strong highlights, Beach, Fireworks, Underwater for enhancing the white

balance in the bluishskewed watery world when the optional waterproof casing is used, and Indoor. In addition to navigating through your photos in playback mode, this lets you dial in quick camera settings while shooting. A central "set" button is mainly used to confirm the chosen settings. Pressing the right arrow toggles the flash through its available modes, which include off, auto and forced on. Redeye reduction can also be enabled and is provided by preilluminating your subject using the focus assist light to reduce pupil size. However, redeye remained a problem in some situations because of the aforementioned proximity of the flash to the lens. Finally, pressing the down arrow toggles from single shot mode to multiple shot mode which offers around 1.3 frames per second, and then again to activate the two or ten second selftimer. With no remote control available for the A400 the selftimer is the only way to take pictures at slow shutter speeds on a tripod. The menus are typical of those find in many of Canon's cameras and include the "my camera" menu for assigning startup sounds and pictures. A quick snapshot of the menus is shown below. For a camera at this price point you're not shortchanged when it comes to a bit of tweaking. Though you can influence the shutter speeds and aperture by manipulating these settings, there are no actual shutter priority or aperture priority exposure modes. Startup time was about five seconds and shutter lag was very respectable which makes it a reasonable choice for action subjects. The rather tight viewfinder was a shame as it left me relying almost solely on the LCD for framing shots, which of course has an impact on battery life.
