This roller enables the dishrack to move in and out of the dishwasher. Because these rollers generally wear out at the same time, we recommend replacing them in pairs. If the door is leaking then the door seal may be defective. If the dishwasher wont fill properly, then the water valve is likely restricted and will need replacement. If the dishwasher is underfilling, it wont clean dishes effectively. Corroded or rusted dishracks should be replaced to avoid parts of the rack falling down and getting into the circulation pump damaging the pump. If detergent dispenser does not open or dispense the detergent or rinse aid properly then dispenser will need to be replaced. Poor washing, leaking and noise during operation are all indications of a circulation pump problem. Since 1912, weve learned to recognize the most common problems. Do any of these look familiar. Bosch dishwasher model SHU53C05UC17 sported its controls on the front of the unit, instead of at the top of the doors edge as in other Bosch models. The dishwasher came fitted for underthecounter placement with an exterior stainless steel door panel. While some problems definitely require a technicians repair, for simpler matters, you can troubleshoot them yourself without a lot of time or expense. Pump Doesnt Work When you open your dishwasher only to find the bottom full of water, dont panic just yet. Check the drain line for kinks or twists and untwist them. The drain line runs from the bottom back of the dishwasher and connects directly into the sinks plumbing just above the Ptrap underneath the sink. Because the dishwasher drains into the sinks plumbing, when the sink clogs, the dishwasher wont drain. Other issues that affect the pump include a clogged large object trap or filter, clogged sink or air gap. Large Object Trap Removal To check the dishwashers filter, remove the utensil tray to access the large object trap found in the bottom center of the dishwasher just in front of the lower spray arm, surrounded by a square mesh screen. Grab the ring handle and move it a quarter turn counterclockwise to lift the large object trap out of the dishwasher. If it contains debris, turn it upside down and gently tap it until the debris falls out. Clean it by flushing with water. Remove the large mesh filter, clean and replace. Dishwasher Runs a Long Time A Bosch dishwasher that runs a long time could indicate a problem with your hot water supply. When there is no hot water, the dishwasher will continue to run. The Bosch dishwasher does have a builtin heater,

which serves to increase the water temperature supplied by your hot water line. You can avoid this problem before you wash by turning on the hot water and letting it run until it gets hot. Turn it off and restart your dishwasher. The cycle should complete once the water is hot enough.<http://www.visualmotion.nl/uploads/compaq-presario-s5000nx-manual.xml>

Rinse Cycle A rinse cycle that doesn't activate could indicate a clogged inlet filter. If you have hard water, calcium and magnesium can build up on the inlet filter and affect the water flow to the dishwasher. The inlet filter sits inside the end of the hose connector of the dishwashers water supply line. The water supply line runs from the hot water valve under the sink to the front of the dishwashers inlet valve behind the bottom kick panel on its left. Turn off the hot water before you unscrew the hose connection to access the filter. You'll need a Phillipshead screwdriver to remove the screws on the bottom panel on either side of the kick panel to get at the connection. Unscrew the hose counterclockwise, but have a towel ready for water drainage when you pull the hose away. Pop the filter from the hose connector. If it's jammed inside it, use a flathead screwdriver to get under its lip and lift out the filter. Clean with an abrasive cleaner and a toothbrush to remove mineral buildup. Reinstall in reverse of removal and don't forget to reopen the water valve fully.

Spray Arm A lower spray arm that doesn't rotate during the wash and rinse cycles usually signifies that food debris could be caught inside it. After removing the bottom tray, remove the lower spray arm by lifting it up from the water supply unit it sits inside, wash and rinse thoroughly and gently pop it back into place. Periodic maintenance and cleaning will keep your Bosch dishwasher in tiptop shape.

Streaked or Dirty Dishes Glassware that comes out of the dishwasher streaked suggests that you used too much rinse aid in the dishwasher. Cut back on the amount of rinse aid in the next cycle to see if that fixes the problem. If your dishes don't come clean enough, you may not be using the correct or enough detergent. When utensils block the spray arms, ensure they move freely before starting the wash cycle.

If you don't replace the large object trap properly, this can also affect the quality of the wash cycle.

Voluntary Recall Bosch dishwasher model number SHU43C05UC17 might have an electrical problem and fire hazard that you cannot troubleshoot, as the manufacturer issued a voluntary recall on Bosch dishwashers beginning with model numbers SHU43C. Visit the manufacturers website to input your specific model number into the appropriate fields to determine if your Bosch dishwasher was recalled. Contact the manufacturer for more information.

Bosch dishwashers are engineered to perform at the highest levels, to spotlessly remove even the toughest soiling. Think baked-in spinach. At the same time, smart technologies ensure that Bosch

power is directed in a way that smartly manages energy and water consumption, and protects delicate items, preserving their brilliant shine wash after wash, year after year. Bosch dishwashers are the quietest. When in action, its noise factor, or rather the lack of it, that'll draw your attention. Our dishwashers are the strong, silent type. They outperform your expectations and the competition constantly earning top rankings from leading consumer publications and test labs worldwide. With a suspended twopump motor system, vibrations and noise are drastically reduced. In addition, Bosch Evolution 500 Series Dishwashers are recognized for their quality manufacturing and are backed by the Good Housekeeping Seal of Approval. Actual delivery times will vary based on your location. If you are ordering multiple items and not all items qualify for Quick Ship, the order will ship when all items are available to ship. Please call Member Services at 18003330663 The recall is an expansion of a twoyearold recall that included 194,000 Bosch, Thermador, Gaggenau, and JennAir dishwashers for a total of 663,000 models in the U.S. and Canada. Over the past two years, BSH Home Appliances, which announced the recall with the Consumer Product Safety Commission, has received five reports of the power cords overheating and causing fires that resulted in property damage. BSH said that the overheating occurred when the dishwashers were in use, not when they were sitting idle. The repair should take less than an hour. You can also call the BSH recall hotline at 8889655813 or go to the website of the brand you own for more information.

Bosch advises owners to pay special attention to the serial number because not every unit from the same model line is included in the recall. If you enter your information on one of the websites, you'll quickly find out whether your machine is included in the recall. Consumer Reports has tested some of the recalled models but did not encounter problems with overheating power cords. We've flagged the affected models in the dishwasher ratings on our website. Any ideas The spray arms are clean and the filter is clean, so I don't believe that's the problem. I'll start it, hot water gets pumped in, and there's a loud hum sound. It'll run for the duration of the cycle, but it won't cycle through the different modes. It's a sound that isn't typical. And sometimes it will sit on the last minute until I cancel the cycle. It is able to drain. I've run the

diagnostic, but I don't believe that's working properly only showing the number "2" which isn't an option online. The Bosch manual is terrible and provides zero information on this. Bosch told me to reach out to an authorized service tech. I'm not finding much information online and before I call the handy man, I'd like to narrow down my options because their troubleshooting gets quite costly. And I'd even do the repair myself if it was reasonable. Checked your circulation pump yet The test ran for about 5 minutes and it wasn't clear when it ended. Not being a technician, if I'm able to access the circulation pump, how would I know there's something wrong with it I'm assuming there's another heating element that may play a role in this Are pumps a big repair Inlet valve, drain motor, heater all seem to be working correctly, even spits out the soap when it should. I have tried a new circulation pump and control panel but no change. Mine is older so no fault codes. What was the fix for your washer Inlet valve, drain motor, heater all seem to be working correctly, even spits out the soap when it should. It's now filling but similar problems to above.

Incidentally the Pressure chamber Water Lever Control System looks a bit full of gunk also, so I'm wondering if this is my overriding issue As No Technician will come to my house now with the current lockdown situation. Couldn't find a glass encapsulated reed switch of the correct size or connection to fit correctly on the pcb. Oh well; Sure possible that the heater circuit pops up as a secondary fault. I took this to mean that you were supplying hot water to the dishwasher. If this was the case it may still require a heating element to increase the temp to the set wash temp if this was higher than what was supplied. If only the top spray arm hasn't moved then it may be a blocked pipe from the circulation pump to the spray arm as usually the lower spray arm is connected nearly at the pump housing Do this with the power totally disconnected from the dishwasher. Depending on your location it could either be 120V AC or 240V AC Both pumps do the same thing as well as the control boards. Nothing sprays. It will go through a complete cycle, fill, etc, even the soap pops out of the dispenser when it should. Everything else seems to work as normal except the circulation pump. I have taken apart the sump further to make sure there aren't any blockages. The aqua sensor looks ok, no build up of anything. It has to be something simple but not sure what else to look at. Any help would be awesome! I took the pump cover off the old one thinking that was the problem to start with something stuck in it, since the motor wasn't spinning and just humming. Any ideas I really appreciate the help. The wire from the capacitor to the motor should have hopefully been checked in the factory since you said that the motor came already supplied with the capacitor As always when using an Ohmmeter, disconnect the power from the machine The pump capacitor wiring is part of the motor assembly, no poor connections or bad wires for either pump. The capacitor wires bridge into the terminals of the motor.

The only wires from the washer connect directly to the motor. A ground, hot, and neutral. The hot black, I believe after turning to white through a connector goes directly to the control panel. The neutral purple, I believe, goes directly to the door switch. The door switch is a three pole switch, the purple from the motor, a brown that goes to the control panel, and a white from the power switch bridged to a brown that goes to the control panel all in this order. I will do some ohms checking of the switch to see what I find but I think this has to be the problem. Your thoughts.
